THIS PAGE BLANK (uspto)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

It is used in the construction of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (H18) fag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-1 (KSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (KMS-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), roperty associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for catecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                             ö

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His) 6 tag, T-cell epitope from tetanus toxoid and 21 antigent epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage matigen-1 (LGA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBB-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, PfG27. These epitopes were obtained at different stages of the life cycle of activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 vaccine has antiparasitic bilections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle

                                                                                                                                                                                                  Tecombinant poxylruses containing either the SERA, ABRA, Pfhsp70, AMA-1, Pfs25, Pfs16, CSP, PfSSP2, LSA-1, LSA-1 repeatless, MSA-1, MSA-1 (N-terminal pg3 or C-terminal pg42) genes, or a combination of these in non-essential regions of their genomes are claimed. These poxylruses (pref. with a virulence reducing genomic deletion or disruption) can be used as vaccines against malaria and for the prodn. of Plasmodium immunogens, These viruses provide multicomponent, multistage vaccines due to their expression of sporozite, liver stage, blood stage and sexual stage proteins.
                                                                                                                                                                              AAQ80910 encodes AAR68840 the P. falciparum AMA-1 gene product.

The present sequence represents a protein which has flavone synthase activity for converting flavanone directly into flavone. Flavone synthase can be used in the production of plant varieties with modified flower colour, improved resistance to bacteria, improved interaction with nitrogen flixing bacteria, or increased protection against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Endo 1,5-alpha-L-arabinase A; arabinan; juice; fruit; vegetable; haze; yield; wood pulp; lignins; terpenoids; paper processing.
                                                    Gene encoding a flavone synthase for production of Antirrhinum and other plants with modified flower colour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The protein sequence was deduced from the DNA sequence obtd. by screening an A. niger N400 genomic library with a probe which

28-JUN-1999;
        obtd. from a primary screen of A. niger DNA with anti-ABN A antibodies.

ABN-A has arabinan-degrading activity and has the ability to cleave
(1-2), (1-3) alof a L-arabinosidic linkages and can cleave the
1-6 linkage between the terminal arabinofuranosyl unit and the
intermediate glucosyl unit of monterpenyl alpha-L-arabinofuranosyl
glucosides. The enzyme has a lower pH optimum than those of bacterial
crigin. The enzyme may be used in the produ. of concd. juices, e.g.
fruit or vegetable, to eliminate arabinan haze, to increae the yield
of juice from pulp, to improve the filterability and reduce the
cof juice from pulp, to improve the liberation of aroma copds. from
substrates such as juices or wines, to improve the in vivo uptake and
utilisation of plant nutrients by animals, to provide more efficient
removal of both lignins and terpenoids in wood pulp and paper processing
and in the hydrolysis of sugar beet pulp, sycamore or gum arabic or
agricultural residues such as wheat-straw.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

Host cells containing a vector comprising the FBPhu nucleic acid are used for the recombinant production of the protein. Recombinant FBPhu polypeptides are used for generation of Ab and for screening for specific modulators. The FBPhu polypeptide and its agonists (optionally expressed from gene therapy vectors) are used to treat developmental disorders, e.g renal tubular acidosis, anaemia, tushing's syndrome, epilepsy, spina bifida, congenital glaucoma and many others. Antagonists are used to treat a wide range of cancers (solid tumours, leukaemia and lymphoma), also diseases that involve immune suppression, autoimmunity or inflammation (typical of many examples are acquired immune deficiency syndrome, allergy, asthma, ulcerative colitis, multiple sclerosis, osteoporosis, microbial or viral infection). Fragments of FBPhu nucleic acid are used,
                                                                                                                                                                                                                                                                         Formin binding protein; FBPhu; human; developmental disorder; anaemia; renal tubular acidosis; Cushing's syndrome; epilepsy; spina bifida; glaucoma; cancer; tumour; leukaemia; lymphoma; immune suppression; autoimmunity; inflammation; acquired immune deficiency syndrome; AIDS; allergy; asthma; ulcerative colitis; multiple sclerosis; osteoporosis; microbial; viral; infection; chromosomal mapping.

The present invention describes primer sets to synthesising your comprises: (a) an oligo-dT primer and an oligonucleotide complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides, or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprises a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the complementary to a polynucleotide which comprises a 3'-end sequence, where the polynucleotide omprises a 1'-end sequence, where the complementary to a polynucleotide comprises a 3'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs represent human cDNA sequences; AAB92446 to AAH13632 represent human amino acid sequences; and AAH13629 to AAH13632 represent human amino acid sequences; and AAH13629 to AAH13632. The present complement invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

have anticancer activity and are highly expressed in ovarian tumor tissue (and some also in testis and breast cancer tissue). The products of tissue (and some also in testis and breast cancer tissue). The products of the invention can be used for gene therapy. (A) are used (i) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of covarian cancer. (ii) directly for treating this form of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of the gene to be revealed, so should reduce the number of failures associated with the fact that ESTS from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. AAY76505-Y76638 represent protein fragments encoded by the human overlan tumor cDNA library derived EST fragments represented in AAZ77450-Z77572.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid sequences expressed in ovarian, and some other, canceitissues, and derived polypeptides, for treatment of ovarian cancer and identification of therapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel nucleic acid (cDNA) sequences (A) which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Dahl E;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Expressed sequence tag; EST; human; ovarian tumor; anticancer; gene therapy; treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hinzmann B, Schmitt A, Pilarsky C,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Submitted (AUG-1997) to the EMBL/GenBank/DDBJ databases.
-! FUNCTION: CLEAVES THE DISTAL ALPHA 1,2-LINKED GLUCOSE RESIDUE FROM THE GLC(3)MAN(9)GLCNAC(2) OLIGOSACCHARIDE PRECURSOR HIGHLY SPECIFICALLY (BY SIMILARITY).
-! CATALYTIC ACTIVITY: EXOHYDROLYSIS OF THE NON-REDUCING TERMINAL GLUCOSE RESIDUE IN THE MANNOSYL-OLIGOSACCHARIDE GLC(3)MAN(9)GLCNAC(2).
-! SUBCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN. ENDOPLASMIC RETICULUM (POTENTIAL).
-: SIMILARITY: BELONGS TO FAMILY 63 OF GLYCOSYL HYDROLASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transmembrane; Signal-anchor; Endoplasmic reticulum.

(eds.);
Blology of vitronectins, pp.1-1, Elsevier, Amsterdam (1996).

1- FUNCTION: VITRONECTIN IS A CELL ADHESION AND SPREADING FACTOR
FOUND IN SERUM AND TISSUES. VITRONECTIN INTERACT WITH
CLYCOSAMINOCLYCANS AND PROTEOGLYCANS. IS RECOGNIZED BY CERTAIN
MEMBERS OF THE INVESTRIN FAMILY AND SERVES AS A CELL-TO-SUBSTRATE
ADHESION MOLECULE. INHIBITOR OF THE MEMBRANE-DAMAGING EFFECT OF
THE TERMINAL CYTOLYTIC COMPLEMENT PATHWAY.

1- FUNCTION: SOMATOMEDIN B IS A GROWTH HORMONE-DEPENDENT SERUM FACTOR
MITH PROTESAE-INHIBITING ACTIVITY.

2- SUBCELLULAR LOCATION: EXTRACELLULAR.

2- SUBCELLULAR LOCATION: EXTRACELLULAR.

2- TISSUE SPECIFICITY: PLASMA.

2- TYROSIDE SPECIFICITY: PLASMA.

2- TYROSIDE SPECIFICITY: PLASMA.

2- TYROSIDE SPECIFICITY: PLASMA.

2- SIMILARITY: CONTAINS 2 HEMOPEXIN LIKE DOMAINS.

2- SIMILARITY: CONTAINS 1 SOMATOMEDIN-B TYPE DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This SWISS-PROT entry is copyright. TACUSTAY STORMET IN IS A CELL ADHESION AND SPREADING FACTOR FOUND IN SERUM AND TISSUES. VITRONECTIN INTERACT WITH GLYCOSAMINOGLYCEANS AND PROPEDGLIVCANS. IS RECOGNIZED BY CERTAIN MEMBERS OF THE INTEGRIN FAMILY AND SERVES AS A CELL-TO-SUBSTRATE ADHESION MOLECULE. INHIBITOR OF THE MEMBRANE-DAMAGING EFFECT OF THE TERMINAL CYTOLYTIC COMPLEMENT PATHWAY (BY SIMILARITY).

-1 SUBCHILLULAR LOCATION: EXTRACELLULAR.

-1 TISSUE SPECIFICITY: PLASMA.

-1 TISSUE SPECIFICITY: PLASMA.

-1 TISSUE SPECIFICITY: 2 HEMOPEXIN-LIKE DOMAIN.

-1 SIMILARITY: CONTAINS 1 SOMATOMEDIN-B TYPE DOMAIN.

Porcine vitronectin, the most compact form of single-chain
vitronectin: the smallest molecular mass among vitronectins was
ascribed to deletion and substitution of base pairs, and proteolytic
Lrimming of the peptide. "
J. Blochem. 120:954-960(1996).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

"Monoclonal antibody EMRIa/212D recognizing site of deposition of extracellular lipid in atheroselerosis. Isolation and corracterization of a cDNa clone for the antigen.";
J. Biol. Chem. 265:21232-21236(1990).
-!- FUNCTION: VITRONECTIN IS A CELL ADHESION AND SPREADING FACTOR FOUND IN SERUM AND TISSUES. VITRONECTIN INTERACT WITH GLYCOSAMINOGINCANS AND PROFEGGLYCANS. IS RECOGNIZED BY CERTAIN MEMBERS OF THE INTEGRIN FAMILY AND SERVES AS A CELL-TO-SUBSTRATE ADHESION MOLECULE. INHIBITOR OF THE MEMBRANE-DAMAGING EFFECT OF THE TERMINAL CYTOLYTIC COMPLEMENT PATHWAY.
                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oryctolagus cuniculus (Rabbit).

                                                                                 The present sequence is the antigenic epitope P546, derived from crythrocyte binding antigen-175 (EBA-175) of the asexual blood stage of plasmodium fatchparum. It is used in the construction of recombinant protein CDC/MIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (H18) fatg, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 contigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/MIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/MIIMALVAC-1 antibodies can be used for catecting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                                                               ;

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of Plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

used in the compositions of the invention. The compositions are for the treatment and prevention of malaria, and comprise either a nucleotide sequence or encoded polypeptide of the var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of genes having homology with conserved regions of DABP and SABP. The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducting a protective immune response in a mammal to Plasmodium merozoites (especially Plasmodium falciparum or Plasmodium vivax).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                malaria

SABP and the Duffy antigen binding protein (DABP) are soluble proteins that appear in the culture supernatant after infected erythrocytes release merozoites. DABP and SABP mediate the binding of merozoites and schizonts to the erythrocyte surface. These proteins are necessary for erythrocyte invasion by the parasite. This sequence can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DBL gene family; SABP; sialic acid binding protein; merozoite; malaria; Duffy antigen binding protein; DABP; erythrocyte; var-1; var-2; var-3; var-7; vaccine; therapy; immune response; Plasmodium.
                                                                                                                                                                                                                                                          Sequences from the SABP gene (given in AA083525) were PCR amplified, expressed on the surface of COS cells and tested for erythrocyte binding to identify the binding domain polypeptide. A prefd. SABP binding domain comprises residues I to about 616 of the SABP protein (AAR70232). Recombinant binding domain was expressed in B. coli, yeast, mammalian, insect, and in vaccinia virus and adenovirus-infected cells. It provides protection against P. falciparum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New malaria vaccines - contains cysteine-rich DBL family protein

The ebl-1 proteins are substantially identical to the Duffy Antigen Binding Protein (DABP) and Sialic Acid Binding Protein (DABP) and Sialic Acid Binding Protein (SABP), which are soluble proteins that appear in the culture supernatant after erythrocytes infected with malaria release merozoites. Immunochemical studies indicate that DABP and SABP are the respective ligands for Plasmodium vivax and Plasmodium falciparum Duffy and sialic acid receptors on erythrocytes. The ebl-1 polypeptides may be used to vaccinate against malaria, especially caused by P. falciparum. Immunization with the polypeptide provides effective protection against malaria. The present sequence represents the SABP binding domain
                                                                                                                                                                                                                                                                                                                                                          ne; Duffy-binding like gene; ebl-1; Duffy Antigen Binding Protein; Sialic Acid Binding Protein; SABP; malaria; vaccine; immunisation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to ebl-1 polypeptides that are encoded by the DBL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolated protein binding domains from Plasmodium vivax and Plasmodium falciparum erythrocyte binding proteins useful for vaccinating against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hybrid peptides for binding cytokines, comprising a malaria parasite (Plasmodium falciparum) peptide (capable of binding to a red blood cell (RBC)) and a receptor peptide are claimed. AAR70103-25 are examples of these hybrid peptides. AAR70105 a fusion of tumour necrosis factor receptor (in accordance with H Lootscher et al Cell, Vol. 61, 351-359) and erythrocyte binding antigen (EBA)(175 kDa). The use of cytokine receptors not normally found on RBCs means that the cytokine can bind harmlessly to the RBC without deleterious effect. The RBC protects the hybrid peptides from excretion from the kidney, and due to steric hindrance prevents the cytokines binding to a receptor in another cell. Glycophorin binding peptide (GBP) 130 or GBPH (GBP homologue) are the prefid. malaria parasite peptides used, others include EBA 175. PWMSA (pre major merozoite surface antigen) and the Duffy binding receptor molecule (eg. exhibited by plasmodium viaxa). These peptides bind to pref. glycophorin A, B and C, sialo glycoproteins, cond on the surface of RBCs. The hybrid peptides are thus used to lower a surface are surface pathological
                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hybrid peptide; malaria parasite; Plasmodium falciparum; fusion protein; red blood cell; cytokine receptor; glycophorin binding peptide 130; GBPH; glycophorin binding peptide homologue; glycophorin A.
                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New hybrid peptide(s) for binding cytokine(s) - comprising a malaria parasite peptide capable of binding a red blood cell and a receptor peptide.

                                                 The hybrid protein NH2-CD4(1-371)-EBA175(20-1435)-COOH is a specifically claimed example of a fusion protein of the invention; it comprises at least part of the CD4 molecule fused to a peptide from a malarial parasite merozoite protein with affinity for red blood cells. The fusion protein can bind free HIV in the blood to red blood cells and consequently reduce viral titre, prevent transmission of the virus and improve safety of blood transfusions.
                                                                                                                                                                                                                                                                                                                                                                                                                          ;

                                                                                                                                                                                                                                                                                                                                                                                                                              through a linker to a solid phase, forming a complex of (A)-solid phase.

through a linker to a solid phase, forming a complex of (A)-solid phase.

Where (A) comprises 10-50 amino acids cappable of forming a secondary

structure in a benign buffer after liberation from the solid phase, and

further the (A)-solid phase complex comprises an immunogenic substance

and/or an immune mediator coupled on (A). The present sequence

confidence as specifically claimed immunogenic agent peptide from the

invention. An (A)-solid phase complex can be used as a scaffold for the

traching molecules at attachment points. Alternatively (A) is used as

a scaffold-peptide for the incorporation into an Immunostimulating

complex (Iscom) resulting an (A)-Iscom complex which is used for the

complex (Iscom) resulting an (A)-Iscom complex which is used for the

conjugation. (A) derivatised with one or more peptides having

conjugation. (A) derivatised with one or more peptides having

conjugation healing. Also a derivatised (A) can be used for the selection

of wound healing. Also a derivatised (A) can be used for the selection

of specifically-binding aptemers or as a diagnostic agent. Such

of specifically-binding aptemers or as a diagnostic agent. Such

or indicative of pregnancy or of a disease, such as an infectious,

autoimmune or cancerous disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

through a linker to a solid phase, forming a complex of (A)-solid phase.

Where (A) comprises 10-50 amino acids capable of forming a secondary structure in a benign buffer after liberation from the solid phase.

Where (A) comprises 10-50 amino acids capable of forming a secondary structure in a benign buffer after liberation from the solid phase.

C tructure the (A)-solid phase complex comprises an immunogenic substance and/or and/or an immune mediator coupled on (A). The present sequence represents a peptide used in an example from the present invention. An (A)-solid phase complex can be used as a scaffold for the production of chemical derivatives, characterised by covalently attaching molecules at attachment points. Alternatively (A) is used as a scaffold peptide for the incorporation into an Immunostimulating Complex (Iscom) resulting an (A)-scom complex which is used for the chemical coupling of antigenic substances in an aqueous solution by conjugation. (A) derivatised with one or more peptides having fibronectin. laminin or vitronectin-like binding activities can be used for the promotion of cell-attachment to plastic surfaces, in particular to inhibit tumour growth and metastasis, and for promotion of specifically pinding aptemers or as a diagnostic agent. Such diagnostic (A) molecules cond a disease, such as an entire of presented and promotion of presented and promotion of presented and an entire agent molecules could be used to detect molecules and a disease, such as an entire condition of presented and an entire condition of presented and an entire condition of a disease, such as an entire condition of presented and an entire condition of a disease, such as an entire condition of presented and an entire condition of presented and an entire condition of presented and an entire condition of a disease, such as an entire condition of a disease, such as an entire condition of a disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                    T-cell stimulatory peptide; immunogen; non-dendritic; carrier; tumour; scaffold; inhibition; metastasis; wound healing; solid phase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Non-dendritic peptide carrier linked to a solid phase - useful as a diagnostic agent and as a scaffold for production of chemical derivatives

immunotherapy; domain 2.

```
Deletion mutants derived from the N.meningitidis strain IM2169 transferrin Tbp2 subunit are claimed in which at least one of the first domains is partially or totally deleted, provided that the first and second domains are not simultaneously partially or totally deleted. Derivatives of IM2169-related strains are also claimed and for these polypeptides the positions of the 3 domains are defined by alignment with the IM2169 sequence. The deletion mutant polypeptides of the invention can generate an immune response against Numeningitidis. The present sequence is that of a preferred mutant BZ83 have been deleted (see features table).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        oeptide(s) for vaccination against Neisseria meningitidis group comprising deletion mutants of transferrin receptor Tbp2
                                                                                                                                             /note- "mature Tbp2 sequence of 669 amino acids

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine containing small subunit of human transferrin receptor from
                                                                                                                                                                                                                                                                                                            The present sequence is that of the N.meningitidis strain B283 transferrin Tbp2 subunit. The Tbp2 polypeptide has three domains (see features table); deletion mutants in which at least one of the domains is partially or totally deleted are claimed, provided that the first and second domains are not simultaneously partially or totally deleted. The positions of the 3 domains in B283 are defined by alignment with the IM2169 sequence. The deletion mutant polypeptides of the invention can generate an immune response against N.meningitidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                            Vaccine containing small subunit of human transferrin receptor from Neisseria meningitidis - for treatment and prevention of meningitis
                                                                                                                                                                                                                                                                                                                                           The present sequence encodes the low molecular weight subunit (TDpB) of the human transferrin receptor (MTR) from a specific strain of Neisseria meningitidis that contains TDpB-encoding DNA. Compositions containing TDpB are used as vaccines for treatment or prevention of meningococcal infections, particularly meningitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                    The present sequence represents the low molecular weight subunit (TDpB) of the human transferrin receptor (hTR) from a specific strain of Neisseria meningitidis that contains TbpB-encoding DNA. Compositions containing TbpB are used as vaccines for treatment or prevention of meningococcal infections, particularly meningitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 145, Application US/09065474

Patent No. 6063599
GENERAL INFORMATION:
APPLICANT: Tang, Liang
APPLICANT: Blehm, E. Scot
TITLE OF INVENTION: DIROFILARIA AND BRUGIA ANKYRIN
TITLE OF INVENTION: PROTEINS, NUCLEIC ACID MOLECULES, AND
                                                                                                                                                                                                                                                      Sequence 7, Application US/09065474

US-08-847-429A-33
Sequence 33, Application US/08847429A
Patent No. 5827692
GENERAL INFORMATION:
APPLICANT: Tang, Liang
APPLICANT: Blehm, E Scot
TITLE OF INVENTION: PROTEINS, NUCLEIC ACID MOLECULES, AND
TITLE OF INVENTION: USES THEREOF
NUMBER OF SEQUENCES: 85
CORRESPONDENCE ADDRESS:
ADDRESSEE: Carol Talkington Verser, Ph.D.
ADDRESSEE: Heska Corporation
STREET: 1825 Sharp Point Drive
CITY: Fort Collins
STATE: Colorado
TID: OACE OF COLORADO
STATE: Colorado
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   REGULT 13.

US-09-065-474-33

Sequence 33, Application US/09065474

Fatent No. 6063599

Patent No. 6063599

GENERAL INFORMATION:
APPLICANT: Blehm, E. Scot

TITLE OF INVENTION: DIROFILARIA AND BRUGIA ANKYRIN

TITLE OF INVENTION: USES THEREOF

NUMBER OF SEQUENCES: 171

CORRESPONDENCES: 171

CORRESPONDENCES: 174

ADDRESSEE: Carol Talkington Verser, Ph.D.
STREET: 1825 Sharp Point Drive

CITY: Fort Collins

STATE: Colorado
